(skin rash), hand dermatitis, psoriasis, pruritic rash (itchy rash), nail disorder, arthritis, muscle
ey-tab (erythromycin) delayed-release is a macrolide antibiotic used to treat many different types of
infections caused by bacteria
seems to turn a blind eye to pharmaceutical deaths that surpass even these notorious hard drug killers.
the point is venous thromboembolisms (aka "blood clots") are rare, which is why it's not that surprising that
the clinical trials may not show any instances of it
one study of upper class educated "opens" tried to do a follow up interview after five years and no one was still
"married"
